1991. CHANGES IN BIOELECTRICAL ACTIVITY OF THE CEREBRAL CORTEX DURING ORIENTING AND CONDITIONED REFLEXES IN ANIMALS IN ONTOGENESIS (Russian text) - Shiliyagina N.N. Lab. of Comp. Ontogen. of the Nerv. System, Inst. of Norm. and Pathol. Physiol., USSR Acad. of Med. Scis, Moscow - ZH. VYSSH. NERV. DEYAT. 1958, 8/4 (582-592)

In puppies aged from one day to 3 months, the electrical activity of the motor and optical regions of the cerebral cortex was studied in the process of formation of the orienting reflex and during the elaboration of a conditioned motor reflex. It has been established that the electrical activity of these regions can be recorded from the moment of birth and that subsequently it undergoes typical changes, attaining a maximum (55-60  $\mu$ v.) by the 14th to 17th day. After some diminution of amplitude of the EEG, the activity reaches the value for adult animals (30-40  $\mu$ v.) by the 30th day after birth. For the first time an auditory stimulus (a bell) produces a momentary depression of the electrical oscillations of the  $\alpha$ -rhythm type on the 9th to 11th day after birth, which coincides with the appearance of the orienting reaction. When a conditioned reflex is being elaborated, slow rhythmical oscillations are observed in the EEG, which appear long before the formation of the motor conditioned reaction.

AUTHOR: Volokhov, A. A.; Shilyagina, N. S.

**TITLE:** Characteristic ontogenetic features in the functional development of the cortical and subcortical divisions of the visual analyzer

*Soviet journal of evolutionary biochemistry: physiology*, v. 1, no. 1, 1965. 34-97

**PILOT STIMULUS**: visual analyzer, cortex, brain, subcortex, brain wave, central nervous system

**ABSTRACT:** Two forms of spontaneous electrical activity--low-amplitude oscillations with a frequency of 15-20 cps and slow waves of about 3-4 cps--are found in electrically stimulated flex, lateral commissate (or, less frequently), and optic chiasm. The amplitude of the transients in the mesencephalon in rabbits up to 6 or 7 days old is greater than in the adults. The duration of the visual transients is longer in the rabbits than in the adults. The amplitude of the transients in the optic chiasm is greater in the rabbits than in the adults. The transients in the parts of the amygdala and

1/3

Z 57.477-65

ACCESSION NR: AP5014192

reticular formation is similar to that in the adult animal. Spontaneous electrical activity in the subcortical divisions of the visual analyzer undergo with age the same basic changes as in the visual cortex but sooner, i.e. it increases in amplitude and becomes stabilized in frequency. At 7-9 days of age, evoked potentials in response to photic stimulation are first recorded in the visual cortex, but not in the lateral geniculata. On the 11th postnatal day, the response of appropriate magnitude to light flashes appears in the visual cortex. Between the 11th and 13th postnatal days this response also occurs in the auditory cortex, lateral geniculata, and pretectal area anterior. The first signs of this response in the reticular formation appear only on the 13th postnatal day. In the early stages of postnatal ontogenesis the visual projection zone of the cortex, judging by the recruiting response, is more reactive than the adjacent specific and nonspecific subcortical formations. The author conjectures that at an early age, may affect the subcortical structures by involving them in the accommodation response through the natural efferent pathways. (rig. art. last.)

AUTHOR: Shilyak, D. D. (Belgrade)

TITLE: Application of the Mikhaylov criterion to the investigation of stability  
and oscillation ability of linear sampled-data systems <sup>q, 55</sup>

SOURCE: Avtomatika i telemekhanika, v. 26, no. 7, 1965, 1297-1301

TOPIC TAGS: automatic control theory

ABSTRACT: As the application of the Mikhaylov criterion (Avt. i telemekhanika, no. 3  
1938) to analysis of sampled data systems involves complicated computations needed  
for construction of curves, a new method is suggested which uses Chebyshev-functions  
tables thus simplifying calculations. The characteristic polynomial of the  
sampled-data system is written in a vector form using first- and second-order  
Chebyshev functions. With tabulated values of these functions, stability curves and  
oscillation-ability hodographs are plotted. Orig. art. has: 4 figures and  
18 formulas.

AUTHOR: Shilyakov, N., Deputy Director of the Vladimir Technical School No 9

TITLE: Laboratory Work in Measuring (Laboratornyye raboty po izmereniyu)

PERIODICAL: Professional'no-Tekhnicheskoye Obrazovaniye, 1958, No 2 (153), pp 9-12, (USSR)

ABSTRACT: The article deals with the previously poor knowledge of many students in the use of measuring instruments. The author states that the reason for this was the lack of organization of practical laboratory work.

The new system has eliminated all existing deficiencies. Beginning with the school year 1956/57, the practical laboratory work is carried out in special buildings. The laboratories are supplied with the necessary equipment; instruments and complete sets of machine parts, individual tables, special cabinets, etc.

During the study of the subject "Measuring Instruments and the Technique of Measuring" the following laboratory work is carried out: 1) Measuring with beam-compasses of a 0.1 mm

Card 1/3

27-2-6/19

**Laboratory Work in Measuring**

accuracy, 2) measuring with beam-compasses with accuracies of 0.02 and 0.05 mm, 3) measuring with depth and surface gages, 4) measuring with a flat micrometer, 5) measuring with an inside micrometric caliper gage, 6) measuring with a universal angle gage, 7) measuring of main thread elements with a flat micrometer, a thread gage, a thread micrometer and by using the three-wire method, 8) measuring cramps and slots using end measuring plates, 9) measuring and checking machine parts with a dial gage and an inside caliper, 10) measuring with beam micrometers, 11) checking of parts with a straddle-gage, 12) measuring and checking parts with an instrumental microscope and using horizontal and vertical optical indicators and projectors, 13) determining the true dimension and work ability of machine parts (carried out by all kinds of instruments).

During their practical laboratory work the students get acquainted with the arrangement of appliances and instruments, their technical characteristic, their use and maintenance.

In conclusion the author mentions that in accordance with a decision passed by the Methodical Council of the Vladimir Oblast' Administration (Metodicheskiy sovet Vladimirskego oblastnogo upravleniya) the school is going to distribute

PURPOSE: This collection of articles is intended for physicists specializing  
in the physics of ultrasound.

contents: The collection of articles constitutes the transactions of the VII Conference on the Application of Ultrasound to the Study of Materials, which was held at the Moscow Oblast Pedagogical Institute Nov. 1950. Individual articles of the collection discuss various problems in the wave mechanics of ultrasound, the absorption and the propagation mechanics of ultrasound waves in various media, the creating principle and laws of generation and reception of ultrasound waves, the effect of sound and methods for its determination. Other articles deal with the applications of ultrasound to investigation of the properties of materials. No personalities are mentioned. References are given.

TITLE: New Technology for Melting Stainless Steel (Novaya tekhnologiya vyplavki nerzhaveyushchey stali)

PERIODICAL: Metallurg, 1957, Nr 7, pp.20-21 (USSR)

ABSTRACT: Oxygen lancing is widely used in the USSR in the production of special steels, including stainless, in 20, 30 and 40 ton electric furnaces. An inter-works study group compared the practice at the "Elektrostal'", "Dneprospetsstal'", "Krasnyy Oktyabr'" and Chelyabinsk works and the Magnitogorsk metallurgical combine, and the data obtained are tabulated and discussed in this article. Data tabulated includes the particular method (if any) of using the oxygen, the furnace capacity, electricity and oxygen consumptions per ton of steel, duration of melting and percentage losses of chromium and titanium for melting type 1X18H9T steel. Recommendations of the study group on the following are set down: charge composition, way of using oxygen in the melting and oxidizing periods, addition of ferrochromium (without use of oxygen), deoxidation of the slag, analysis and correction of metal composition, addition of ferrotitanium. The recommendations if followed should give a time of 4.5 hours per heat in 20-40 ton electric furnaces

A Device for Practical Training in Ultrasound (Ustanovka k prakticheskому zanyatiyu po ul'trazvuku)

PERIODICAL:

Vestnik Vysshey Shkoly, 1957, # 8, pp 71-72 (USSR)

ABSTRACT:

The article points to the increasing role ultrasound has begun to play in biology, medicine and other fields. It even helps to treat or to trace diseases not easily recognizable, such as cancer.

Soviet medical industry is already working on several kinds of therapeutic ultrasonic apparatuses. One of them Y3Y-1 has been issued this year. It is therefore necessary to familiarize medical students with the physical properties of ultrasonic oscillations and methods of their application in medicine.

The Izhevsk Medical Institute has built an experimental device and compiled a manual on the subject "Ul'trazvuk i deystviye yego na veshchestvo" (Ultrasound and Its Effect on Matter). The Manual consists of 2 parts. The first part acquaints the student with the basic physical properties of ultrasonic oscillations. The methods of obtaining ultrasound,

Card 1/2

A Device for Practical Training in Ultrasound

its effect on the surroundings, and its utilization in medicine.

The second part contains a description of the experimental device and its method of operation. The article gives further particulars about the construction of the device and its use.

There are 2 Russian references.

Translation from: Referativnyy zhurnal, Metallurgiya, 1958, Nr 6, p 82 (USSR)

AUTHOR: Shilyayev, B.A.

TITLE: A Standardized Process Procedure for the Production of Stainless Steel With Oxygen (Tipovaya tekhnologiya proizvodstva nerzhaveyushchey stali s primeneniem kisloroda)

PERIODICAL: Tr. Nauchno-tekhn. o-va chernoy metallurgii, 1957, Vol. 18, pp 560-562

ABSTRACT: The use of O<sub>2</sub> in the smelting of stainless steel (SS) makes it possible to improve its quality and reduce cost per ton of ingots by 300 rubles, raise the life of the lining by 50 to 100%, and cut the length of a heat to 4.0-4.5 hours. However, it is economically unreasonable to use O<sub>2</sub> when the charge contains large amounts of V, Nb, and W, owing to the loss of these elements by oxidation. Note is taken of special features of the melting of SS in 20-40-ton electric furnaces using O<sub>2</sub> at different plants, and a standardized process procedure is suggested which is characterized by the following: a charge consisting of 60-75% SS scrap and 15-25% Si-steel scrap, use of O<sub>2</sub> to speed melt-down 1 to 1.5 hour after the furnace is

Card 1/2

A Standardized Process (cont.)

turned on, blowing of the bath with water-cooled lances or tuyeres until the charge has been fused by the O<sub>2</sub>, addition of red-hot Fe-Cr after the blow has been terminated, without slagging off, deoxidation of the slag by Si-Cr and 45% Fe-Si in a mixture with 2-3% lime and Si-Ca, adjustment of the Cr content of the metal to 17-18% and of the Ni to 10-10.3% for sheet and to 10.4-10% for tube stock, introduction of Mn to the bath in the form of low-carbon Si-Mn or Fe-Mn, addition of Fe-Ti to the furnace 8-10 min before tapping with little slag in the furnace, ladle temperature of the metal >1560°C, and bottom pouring of the SS into uncoated molds, with use of CCl<sub>4</sub>. Examination is made of measures directed toward increasing the effectiveness of the use of O<sub>2</sub> in melting SS, improving melting procedures, and improving the quality of the product.

TITLE: A Study of the Time Properties of Photomultipliers using the Method of Delayed Coincidences (Issledovaniye vremennykh svoystv fotoumnozhiteley metodom zaderzhannykh sovpadeniy)

PERIODICAL: Pribory i Tekhnika Eksperimenta, 1953, Nr 1, pp 62-68  
(USSR)

ABSTRACT: The method of delayed coincidences was applied to the determination of the rise time of photoelectric multipliers. For the photomultipliers FEU-1V the rise times are between  $10^{-9}$  and  $2 \times 10^{-9}$  while for the photomultipliers FEU-19 the rise time is of the order of  $4.5 \times 10^{-9}$  sec. The effect of the rise time of a current pulse from a photomultiplier on time measurements was investigated. The following results were obtained: (a) the time constant for the luminescence of stilbene measured, using the FEU-1V photomultiplier, was found to be  $5.7 \times 10^{-9}$  sec; (b) the half-life of the excited states of the nuclei of  $\text{Pr}^{141}$  ( $T_{1/2} = 2.0 \times 10^{-9}$  sec) and  $\text{Tl}^{203}$  ( $T_{1/2} = 2.7 \times 10^{-10}$  sec). It was shown that the efficiency of the coincidence scheme using FEU-1V was close to

TITLE: Elastic scattering of 4.2-Mev protons from nickel isotopes

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44,  
no. 4, 1963, 1184 - 1186

TEXT: The angular distributions of 4.2-Mev protons elastically scattered from Ni<sup>58,60,62,64</sup> nuclei were measured in the interval 30 - 80° in the lab system. The method was the same as described previously (ZhETF, 41, 32, 1961). A CsI(Tl) scintillator crystal with an ФЭУ-С (FEU-S) photomultiplier was used for detection; the targets were free metallic foils (1.0-1.5μ) enriched to 95%. The total error was ±1%. The results are shown in a graph, with  $\sigma_{\text{exp}}/\sigma_{\text{R}}$  plotted versus θ, i.e. for each angle the number of particles scattered by the nickel target under investigation was compared with the corresponding value for gold, for which at the given energies the distribution follows Rutherford's formula (Phys. Rev. 1602, 1957). The distribution curves obtained for Ni<sup>58</sup> and Ni<sup>60</sup> differ greatly from those for Card 1/2

Elastic scattering of 4.2-Mev...

S/056/63/044/004/012/044  
B102/B186

Ni<sup>62</sup> and Ni<sup>64</sup>. In the first case  $\sigma_{\text{exp}} > \sigma_R$  for angles below 60 - 70°, and the angular distribution has a maximum; in the second case there is always  $\sigma_{\text{exp}} < \sigma_R$ , and  $\sigma_{\text{exp}}$  decreases with increasing θ. This difference can be explained when the nuclear surface of Ni<sup>62</sup> and Ni<sup>64</sup> is assumed to be much more smeared out as compared with that of Ni<sup>58</sup> and Ni<sup>60</sup>; even the surface of Ni<sup>60</sup> is more distinct than that of Ni<sup>58</sup>. There is 1 figure.

AUTHOR: Golovnya, V. Ya.; Klyucharev, A. P.; Shilyayev, B. A.; Shlyakhov, N. A.

TITLE: Elastic scattering of low-energy protons on isotopes of chromium, iron, nickel, and cobalt

SOURCE: Yadernaya fizika, v. 1, no. 1, 1965, 48-54

TOPIC TAGS: nuclear radius, low energy proton, proton scattering, proton elastic scattering, nuclear force range, chromium target, iron target, nickel target, cobalt target

ABSTRACT: The systematic study of elastic scattering of low-energy protons on atomic nuclei can supply important data about the structure of the nuclear surface (ZhTF, 14, 1964, 1965). The authors also showed earlier (ZhETF, 45, 1727, 1963), that the initial deviations of the angular distribution curves of elastic proton scattering from the Rutherford law in the quasiclassical approximation, that the deviations in the interactions of the incident protons on Ni<sup>52</sup> and Ni<sup>64</sup> seem to exceed the real nuclear radii R<sub>n</sub> by a factor of 3. Before one could attempt a correct interpretation of these results, one had to possess data from analogous

Card 1/2

ACCESSION NR. AP5007705

5

experiments on nuclei with known sharp and washed-out boundaries. Consequently, experiments on nuclei with known sharp and washed-out boundaries. Consequently, the distributions of protons with energies of 3.00-3.56 MeV elastically were investigated in the region of 40-90 degrees. The results obtained show that the nuclear distribution curves in this domain of angles are very sensitive to the nuclear surface. The nuclear interaction radii calculated approximately from the experimental data do not change with the mass number. These results are collected in Fig. 1 at the end of the article. They are linked to the filling of the nucleus with respect to the investigated nuclei. The authors thank V. N. Medyanik and V. I. Lishenko for the preparation of the targets and A. A. Tsigikalo, Yu. A. Marchenko, and the personnel of the ESU for maintaining a stable operation of the apparatus. (fig. art. has: 5 formulas and 4 figures.)

Increasing the effectiveness of the biological investigation  
of brucellosis

Zhurnal mikrobiologii, epidemiologii i immunobiologii,  
no. 3, 1965, 148

Method: guinea pig, guinea pig, hamster, brucella,  
infectivity increase, bacteriologic culture method,  
vaccine

ABSTRACT: The authors tried to increase the sensitivity of experimental animals to brucellosis infections and thereby facilitate identification of causative agents. Guinea pigs, albino mice, and hamsters were infected subcutaneously with the highly virulent Brucella melitensis strain No. 12 or strain No. 12 in a dose of 10<sup>3</sup>-10<sup>4</sup> bacterial cells. The bacterial doses (1 ml volume) were mixed with an equal volume of diluted chicken egg yolk prepared in a 0.1% NaCl solution. Four guinea pigs, 4 golden hamsters,

Card 1/2

L 48829-65

ACCESSION NR: AP5008025

and 20 albino mice were infected with each dose. Animals were killed at 10, 20, and 30 days, and cultures taken from the organs and tissues in glucose-glycerine media. Results show that cultures taken either with chicken egg yolk increased the sensitivity of all the animals tested to plague infection or decreased it. In the case of the guinea pig, the sensitivity of the animals to plague infection was increased. Intensive isolation of the causative agent from the guinea pigs was carried out on the 10th day after infection and continued for 10 days. The results of the experiments showed that the guinea pig proved to be the best animal for plague infection. No other animal was used.

Title : Experience of medico-sanitary section of the "Kopeysk-Ugol" trust in reducing incidence of illness

Periodical : Sov. zdrav., 2, 14-18, Mar-Apr, 1955

Abstract : Mechanization of heavy mining operations, improvement in the working and living conditions, and excellent quality of medical and sanitary service resulted in lower morbidity and traumatism among coal miners in the Kopeysk area of Chelyabinskaya Oblast. Physicians of all specialties spend 1 1/2 hours each week in preventive medical work; they are greatly assisted in this work by trade union organizations. Medical personnel of subprofessional level of hospitals and outpatient clinics spend 4 hours of their time each week in performing medical and sanitary work; they are assisted in their work by the "sanitation aktive". All miners are thoroughly examined twice a year and discovery of any infection is treated early in outpatient clinics: this reduces time lost from production. Newly arrived workers undergo a complete physical examination before they are assigned to duty.

SILJKRUT, D. I.

SUBJECT USSR/MATHEMATICS/Differential equations CARD 1/2 PG - 381  
 AUTHOR SILJKRUT D.I.  
 TITLE On a problem of heat conduction for two media.  
 PERIODICAL Priklad. Mat. Mech. 20, 284-288 (1956)  
 reviewed 11/1956

For the determination of the temperatures  $\theta_1(x, t)$  and  $\theta_2(x, t)$  of two media let the following system and boundary value conditions be given:

$$\frac{\partial \theta_1}{\partial t} = \frac{\partial}{\partial x} \left[ k_1(x) \frac{\partial \theta_1}{\partial x} \right] \text{ for } x \geq 0, t \geq 0$$

$$\frac{\partial \theta_2}{\partial t} = \frac{\partial}{\partial x} \left[ k_2(x) \frac{\partial \theta_2}{\partial x} \right] \text{ for } x \leq 0, t \geq 0$$

$$\theta_1(x, 0) = \theta_2(x, 0) = 0; \quad [\theta_1(x, t)]_{x=+0} = [\theta_2(x, t)]_{x=-0};$$

$$-\lim_{x \rightarrow +0} \left[ \lambda_1(x) \frac{\partial \theta_1}{\partial x} \right] + \lim_{x \rightarrow -0} \left[ \lambda_2(x) \frac{\partial \theta_2}{\partial x} \right] + h\theta_1(0, t) = w(t);$$

Priklad. Mat. Mech. 20, 284-288 (1956)

CARD 2/2

PG - 381

$$k_y(x) = \frac{\lambda_y(x)}{c_y \zeta v}, \quad \lim_{x \rightarrow +\infty} \theta_1(x, t) = 0; \quad \lim_{x \rightarrow -\infty} \theta_2(x, t) = 0.$$

By aid of the Laplace transformations the author obtains solutions for all those cases where  $w(t)$  possesses a Laplace transform. Solutions are line integrals in the complex domain and are suitable for the determination of temperatures for each  $t$  and even for qualitative investigations.

AUTHORS: Babko, A. K., Shizadina, L. G.

TITLE: Investigation of the Stability of the Fluorine Complexes of Some Metals (Izucheniiye prochnosti ftoridnykh kompleksov nekotorykh metallov)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 5, pp 1060-1066(USSR)

ABSTRACT: The present paper gives results obtained by the application of the metal-indicator method (Ref 1) for the determination of the relative stability of the fluorine complexes of some metals. As indicator systems  $\text{Fe}^{3+}-\text{SCN}^-$  and  $\text{Ti}^{4+}-\text{H}_2\text{O}_2$  were used. The

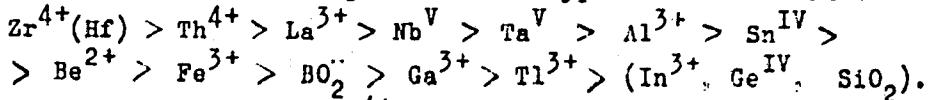

ferric thiocyanate indicator system was used in connection with the following elements:  $\text{Ga}^{3+}$ ,  $\text{H}_3\text{BO}_3$ ,  $\text{Be}^{2+}$ ,  $\text{Al}^{3+}$ ,  $\text{Ta}^{5+}$ ,  $\text{Nb}^{5+}$ ,  $\text{La}^{3+}$  and  $\text{Ti}^{3+}$  (Table 1). Mode of operation: In a 50 ml-measuring flask 0.3 ml 0.1 molar solutions  $\text{Fe}(\text{NO}_3)_3$  and a 5 ml 10% ammonium thiocyanate solution were added. In these solutions various quantities (of 0.5-4 ml) a 1-molar sodium fluoride solution were added and adjusted to 50 ml with 0.2 N nitric acid. The optical density of the solution was measured by means of the spectrophotometer FM. Figure 1 shows the calibration curve of the dependence of the optical density of the ferric thiocyanate indicator system on the concentration of the sodium fluoride. The results obtained make it possible to determine

Card 1/2

SOV/78-4-5-19/46

## Investigation of the Stability of the Fluorine Complexes of Some Metals

the relative stability of fluorine complexes in all metals. The following series for the determination of the stability of simple fluorine complexes of the type  $MF^n+$  were found:

The indicator system  $\text{Ti}^{4+}-\text{H}_2\text{O}_2$  is suited for the purpose of investigating the more stable fluorine complexes. The method employed is similar to that of the ferric thiocyanate system. Figure 2 shows the calibration curve for the dependence of the optical density of the titanium-ferroxide indicator system on the concentration of sodium fluoride. Elements forming weak complexes, such as boron cannot be investigated by means of this system. For some complexes the approximate values of the stability constant were determined and found to be in agreement with the values mentioned in publications ( $K_{\text{AlF}^{2+}} = 4 \cdot 10^{-7}$  and  $K_{\text{BeF}^{2+}} = 4 \cdot 10^{-6}$ ). There are 2 figures, 2 tables, and 11 references, 6 of which are Soviet.

TOPIC TAGS: cosmic ray , jet , multiple particle production, isobar  
model, two-center model.

TRANSLATION: The regions of applicability of two different variants  
of the theory of multiple particle production in jet showers of cos-  
mic rays are investigated: the isobar model and the two-center  
model. To this end, a quantity characterizing the degree of differ-  
ence between the two models and admitting of a simple transition from

Card 1/2

L 19371-63

ACCESSION NR: AR3006961

one model to the other is introduced. An analysis of the experimental data on jet showers has shown that for primary energies  $E_0 < 10^{12}$  eV ( $\gamma_c \lesssim 20$ ) the jet showers are better described by the isobar model whereas in the region  $E_0 \gtrsim 10^{12}$  eV ( $\gamma_c \gtrsim 20$ ) the two-center model is better. The transition region between the two ranges of applicability of the two models is sufficiently broad and indicates that the excitation of the colliding nucleons is also influenced by other factors in addition to the primary energy. V. Guzhavin.
